Report

◆ Input matrix M 為 m*n, N 為 n*p Output matrix O 為 m*p

(input size 的 m, n, p 必須在程式的第 28, 77, 29 行做更改)

Map

假設讀到的輸入為"M, i, j, M_ij", 則製造出的 Key-Value 為(i, 0)- [M, j, M_ij]、(i, 1)- [M, j, M_ij]、(i, 2)- [M, j, M_ij]、...、(i, p)- [M, j, M_ij];若讀入的輸入為"N, j, k, N_jk" 則作與上述相對應的處理,由此得到所有的 Key-Value。

```
28
              int m = 500;
29
              int p = 500;
30
              String line = value.toString();
31
              String[] words = line.split(",");
             Text outputKey = new Text();
33
             Text outputValue = new Text();
34
             if (words[0].equals("M"))
35
36
                  for (int k = 0; k < p; k++)
37
38
                      outputKey.set(words[1] + "," + k);
                      outputValue.set(words[0] + "," + words[2] + "," + words[3]);
39
40
                      context.write(outputKey, outputValue);
41
42
43
              else {
44
                 for (int i = 0; i < m; i++)
45
46
                     outputKey.set(i + "," + words[2]);
                     outputValue.set("\mathbb{N}," + words[1] + "," + words[3]);
47
48
                      context.write(outputKey, outputValue);
49
```

Reduce

對 Map 後的結果將 Key 相同的 Values 分為同一組,因此對於 Key (i, k) 所對應到的 Values 為{[M, 0, M_i0]、[M, 1, M_i1]、…、[M, 1, M_ip]、[N, 0, N_0k]、[N, 1, N_1k]、…、[N, p, N_pk]},以"M","N"為區別將 Values 分到 hashM 及 hashN 中,再將每個 Value 後面的兩個值存成新的 key-value,例如: [M, 0, M_i0]就會被分到 hashM 中,其新的 key-value 為(0)-(M_i0)。將 hashM 及 hashN 中以 key 做區分,將相對應的 value 相乘後取其總和即為 O_ik 的結果, EX: O_ik = M_i0*N_0k + M_i1*N_1k + … + M_ip*N_pk。

```
61
                String[] value;
                {\tt HashMap}{<} {\tt Integer}, \ {\tt Integer}{>} \ {\tt hashM} = \ {\tt new} \ {\tt HashMap}{<} {\tt Integer}{>} \ (\tt) \ ;
 62
                HashMap<Integer, Integer> hashN = new HashMap<Integer, Integer>();
 63
 64
                for (Text val : values)
 65
                    value = val.toString().split(",");
 66
 67
                    if (value[0].equals("M"))
 68
 69
                        hashM.put(Integer.parseInt(value[1]), Integer.parseInt(value[2]));
 70
 71
                    else
 72
 73
                        hashN.put(Integer.parseInt(value[1]), Integer.parseInt(value[2]));
 74
 75
 76
 77
                int n = 500;
 78
                int sum = 0;
 79
                int m_ij;
 80
                int n_jk;
 81
                for (int j = 0; j < n; j++)
 82
 83
                   m ij = hashM.containsKey(j) ? hashM.get(j) : 0;
 84
                   n_jk = hashN.containsKey(j) ? hashN.get(j) : 0;
 85
                    sum += m ij * n jk;
 86
 87
 88
                Text out = new Text(key.toString() + "," + Integer.toString(sum));
89
                context.write(null, out);
```
